

Help 3.0a

Done!

- Renumber help with letters for columns: A1, A2, A3, B1, B2, B3 etc. Also improve contrast of font used for number labels, and resize them smaller, so they are less distracting and fit better in-between tight spaces on screenshots.
- Change graphic representation of screenshots from showing several items of an interface in one screenshot, to showing each row or item in an interface separately.
- Improve back to app script so it now returns to the window on which they clicked the help button.
- Fix close help script so it closes all help windows when run instead of just one window, which can mean that some help windows are still open, so help is still open; not closed.
- Fix FileMaker bug for large layouts, which fail to show their contents unless the window is resized.
- Improve the script used to go to help layouts so it does not focus on place in the middle of the layout, but on the upper left corner of the layout.
- Notify users about help provided that is for older versions of the app when they first navigate to such help.
- Create a new script that can be triggered by other apps help buttons to take user to the help layout and column the user wishes to view.
- Improve the tutorial module so when opened the tutorial buttons are highlighted to give user a constant reminder they are running a tutorial. Also improve the ability of the tutorial script to scroll the help window to correct location specified by the tutorial step on both the desktop and iPhone/iPad versions.
- Add the ability in the tutorial module to quickly remove text formatting.
- Improve the scroll feature in tutorials so empty records at the end of a tutorial that are necessary to make it scroll are conditionally formatted to appear black and so blend in with the footer.
